

Robotics & Agri-Intelligence

Prof Tristan Perez

Leader Qld DAF - Strategic Investment in Farm Robotics (SIFR)

Queensland University of Technology - QUT

Food Security

Will we be able to feed 9 billion people in 2050?

Australia faces a real challenge to ensure its participation in food production is both competitive and sustainable

ROBOTICS IN AGRICULTURE

Robotics in Agriculture

Robot-enabled sensing

- Weed detection & classification
- Crop yield estimation
- Soil characteristics
- Flower & fruit detection and localisation
- Pest and disease detection & monitoring
- Harvesting of big data
- Animal health and quality monitoring

Robot-enabled Acting

- Herbicide application
- Alternative weed destruction
- Pest control agent application
- Pollination
- Harvesting
- Irrigation
- Animal intervention

Agri-intelligent systems

- Making sense of data - data analytics
- Risk-informed decision support - from data to decisions
- Improved strategies for spacio-temporal application of inputs
- Improved strategies for weed and pest management
- Harvest scheduling optimisation
- Improved business decisions

Enabling factors

- Trusted autonomy
- Regulation/ Certification
- Economics & business
- Legal
- Sociology
- Human-robot interactions

AgBots

- Lower soil compaction
- Optimised operation and multimode weed management
- Fault tolerance through physical redundancy
- Distributed sensing enabling new tools for Precision Agriculture (AgBot+UAV)
- Distributed action (Variable rate application of inputs for SSCM)
- Multi-purpose platform: weed, fertiliser, harvesting (horticulture)
- Long endurance and safe operation (day/night)
- Avoidance of casual workforce

The Bigger Picture

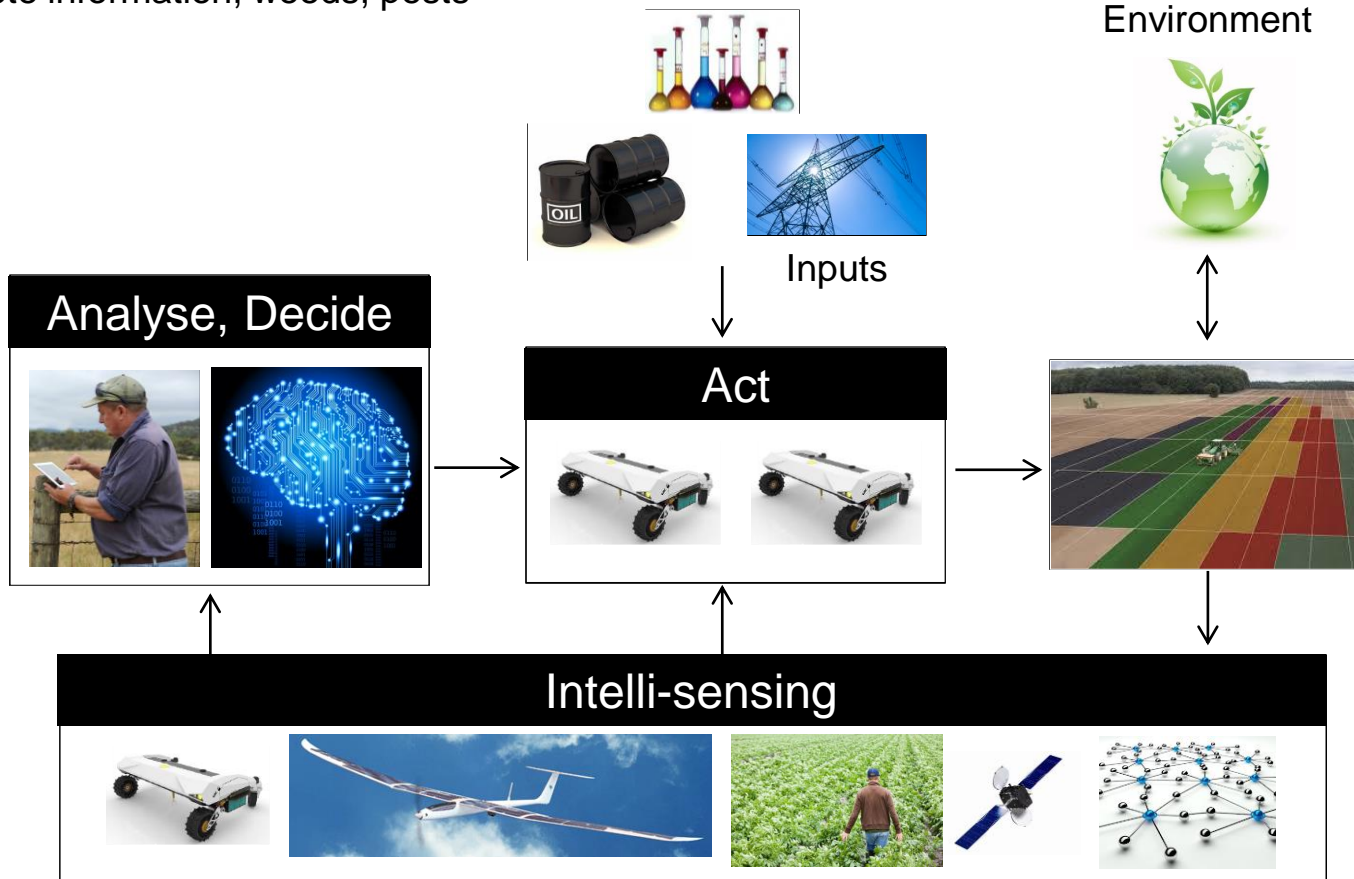

Today

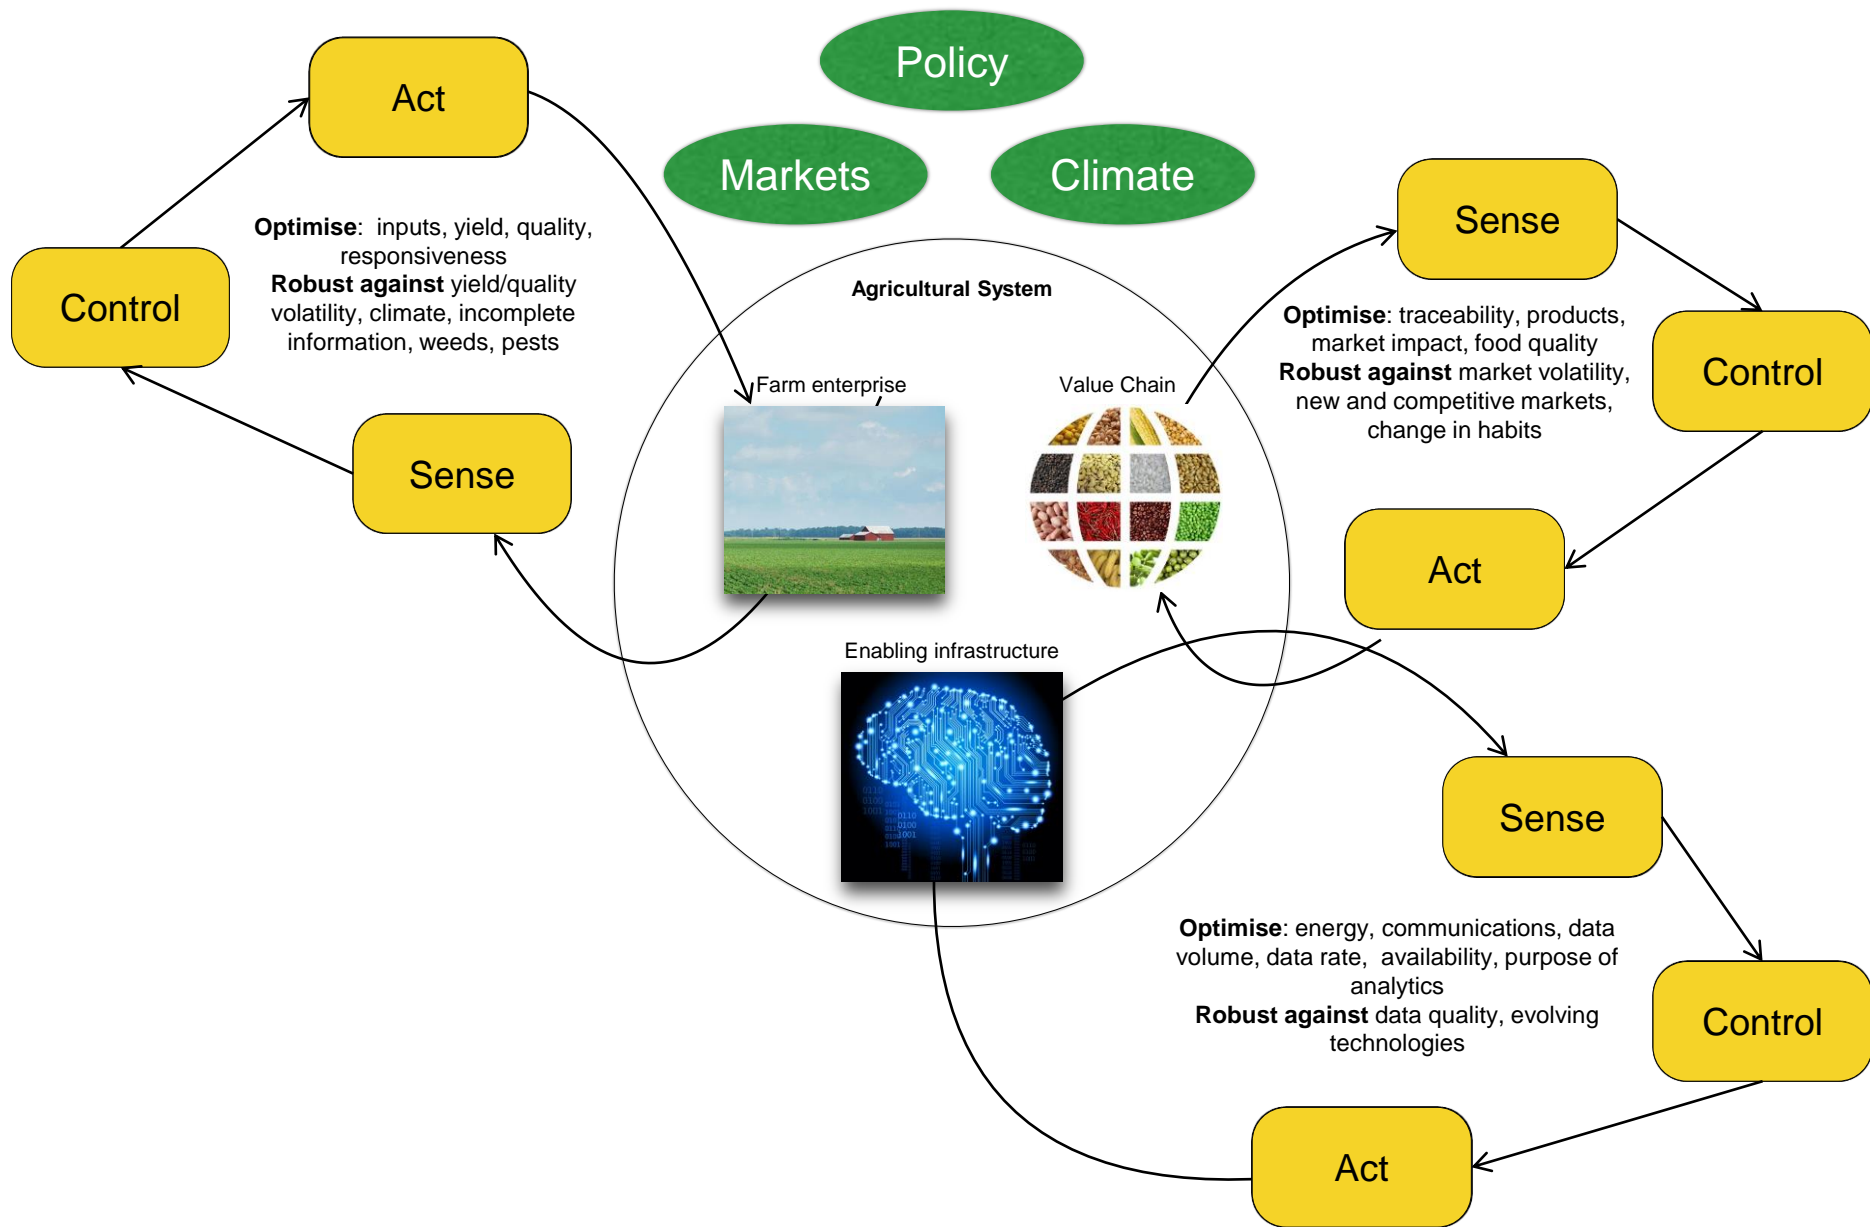

Optimise: inputs, yield, quality, responsiveness
Robust against yield/quality volatility, climate,
incomplete information, weeds, pests

Tomorrow

Optimise: inputs, yield, quality, responsiveness
Robust against yield/quality volatility, climate,
incomplete information, weeds, pests

Future workforce
