What is a pressure injury?

- A pressure injury is an area of skin that has been damaged because of:
  - unrelieved pressure
  - friction or shear (e.g. poorly fitting shoes)
  - presence of constant moisture

- They commonly occur on the heels, toes or buttocks

Pressure injuries are also called:
- Pressure ulcers or areas
- Pressure sores or bed sores
- Decubitus ulcers (decubiti)
- Pressure necrosis
- Ischaemic ulcers

How you can help care for a pressure injury

Many of the actions listed (next page) to prevent pressure injuries will also help heal an ulcer if present, i.e.

- Relieve the pressure from the injury area e.g. do not lie on that area, do not rub the area
- Obtain advice from your doctor or nurse on special equipment which can relieve the pressure

Risk Factors
- Reduced mobility
- Loss of sensation or feeling
- Impaired mental state
- Incontinence
- Poor nutrition
- Dry skin
- Acute or severe illness

How to prevent a pressure injury

✔ Do
- Apply moisturiser twice daily
- Use mild, pH neutral, non-irritant skin cleansers and body products
- Protect skin exposed to friction
- Check your skin regularly and seek help if you have any sore, red, blistered or broken skin
- Eat a nutritious diet
- Use pillows and foam wedges to protect bony prominences
- Avoid heel or sacral contact with hard surfaces

✘ Don’t
- Do not massage or rub the skin over bony areas (e.g. hip bones)
- Do not sit in a chair for long periods of time—change position regularly
- Do not use foam rings, donuts, or fluid filled bags
- Do not leave the skin in contact with moisture for long periods of time
